

PUMP TIPS

SUCTION LIFT

Maximum theoretical suction lift for self-priming pumps is 25 feet sea level.

HOSE SIZE

1. Best to use a hose that matches the pump size.
2. Larger suction hose will tend to overload engine but increase capacity.
3. Larger discharge reduces friction loss; no effect on pump.
4. Length of hose depends on vertical rise and hose size-generally limit to 500ft. or 50 ft. for diaphragm pumps.

PRESSURE

1 psi=2.31 of head. A pump that has a maximum head capacity of 100ft. will develop 43 psi (100'=43.3 psi divided by 2.31)

PUMP PERFORMANCE
